ENFORCER[®] ABLOY padlocks for trailer and shipping container doors use a series of disc tumblers that function like the tumblers in a bank safe. Only the correct key turned 90 degrees will align the discs and gates. These heavy duty, high security padlocks are designed for rugged conditions.

Spring-Free Construction

No critical springs to break, corrode or jam if foreign material is inserted; great for outdoor use. The keyway face spins freely to prevent drill bits from penetrating the lock.

Hardened-Steel Lock Housing

Provides tough resistance to physical attack on trailers such as drills, chisels and cutting tools. ABLOY product is also bump-proof.

Chrome Plated Lock Body

Provides maximum resistance against corrosion in coastal and marine environments.

False Gates

Provide an additional safeguard, making picking virtually impossible.

Heel & Toe Locking

Stainless steel ball bearings dead-lock the shackle at both ends for a strong hold.

Heavy Duty Keys

Constructed of nickel silver to provide smooth, reliable operation with lasting durability.

Locks can be keyed alike, different or different to a master system with one key that can open all of the locks. Many large fleets choose to key each location or terminal to a different key code with a master key that opens locks to all locations. Master systems can also be applied across different types of ENFORCER locks.

Many of the ENFORCER locks utilize ABLOY cylinders or padlocks. View products at TransportSecurity.com
